(MSIC) is a utility program for MSI mainboards. MSIC is a powerful overclocking tool for MSI mainboards in order to squeeze the maximum performance out of your mainboards. MSI mainboards include MSI display interfaces with multiple resolutions for an optimum setup, MSI motherboards are also equipped with advanced and flexible RAID controllers. These RAID controllers come with hot-plug card connectors, some of which are pci-e, in order to add RAID storage devices, such as hard drives, into your system.<sup>[4]</sup> In fact, the risk of stroke is increased in both eyes open and closed conditions.<sup>[4]</sup> The reasons for this phenomenon are not clear, but the most likely explanation is related to loss of compression in the head due to cerebral aneurysms. None of the patients in this study suffered from SAH or an intracerebral hemorrhage. The size

---

of the aneurysm, however, can result in increased flow velocity and pulsatile pressure, which in turn can cause hemorrhage. This study has a limitation. First, although, dilatation of the distal ICA was observed in 2 patients in this study, those patients did not exhibit symptoms of brain ischemia. The reason for this discrepancy is unclear and further study is needed to assess this risk in a larger patient population. Second, this is a single-center study, and the patients were not randomized. Conclusion

{#jah34923-sec-0022} =====

It was found that the percentage of the proximal ICA territory exhibiting CBF velocity changes in the circle of Willis was significantly decreased in patients with aneurysmal SAH with posterior circulation aneurysms. However, the mean CBF velocity in the proximal ICA territory and A1 were significantly increased in patients with a history of aneurysmal

SAH. These findings are important when planning and performing procedures to prevent embolic complications associated with the aneurysm. Disclosures

## MSI Control Center For PC

MSI Control Center is the modern replacement for the former F3 BIOS utility. It enables you to optimise your computer, LAN and audio systems, monitor and control Windows devices, manage Windows Security, internet settings and CPU and RAM overclocking. It also provides an extensive overclocking wizard to boost your computer's performance.

1. Technical Field The present disclosure relates to the field of electronic displays, and more particularly to a pixel structure and method of manufacturing the same.

2. Description of Related Art Recently, thin film transistor liquid crystal displays have been one of the most broadly applied products in the field of display industry. However, it is always desirable to continuously improve the yield of the thin film transistor liquid

---

crystal displays. In general, a thin film transistor liquid crystal display includes a display panel, an active device substrate, and a tape carrier package (TCP). The display panel has a first substrate and a second substrate bonded together with a liquid crystal layer therebetween. The active device substrate and the first substrate are bonded together, and the active device substrate and the second substrate are bonded together. The active device substrate further includes a plurality of thin film transistors arranged on the substrate and a plurality of gate signal lines and data signal lines respectively formed along a top surface and a bottom surface of the active device substrate. The tape carrier package is bonded to a back side of the active device substrate. There are some defects in the production of thin film transistor liquid crystal displays, such as a contact defect between the gate signal lines of

---

the active device substrate and the gate signal lines of the display panel. In detail, the gate signal lines of the display panel are located in different regions of the display panel, and a distance between the gate signal lines of the display panel and the gate signal lines of the active device substrate is generally greater than a distance between the gate signal lines of the active device substrate and the data signal lines of the active device substrate. The distances from the gate signal lines of the display panel to the gate signal lines of the active device substrate, and the distances from the gate signal lines of the active device substrate to the data signal lines of the active device substrate must be shorter, and the contact of the data signal lines of the active device substrate and the display panel becomes worse. In order to improve the contact between the gate signal lines of the active device substrate and the data

---

signal lines of the display panel, a pixel structure and a method of manufacturing the same are desired to be provided to overcome the above-described
